

Introduction

These are quite simply the most realistic artificial trees on the market. Each one is hand built by genuine artists who have developed a building technique over many years that can create the ideal tree for every situation. Every detail, the clear stem, the width of the canopy, the number and location of branches, the shape and thickness of the crown, the number of leaves – simply everything can be specified and a drawing supplied for approval before the magic begins. Best of all, access is never a problem. These trees are supplied as ‘kits’ that are easily assembled on site. Typically a 4m tree can be supplied on a single pallet. We have supplied trees of up to 8m height with a 4-5 m spread that could be taken up a typical single width staircase and installed many floors up.

Much of our work comes in the form of repeat business or personal recommendation as our clients are so bowled over by the change in a building’s ambience that these trees create. Everything is available, from beautiful blossom trees, to majestic European oaks, tropical Ficus and Mediterranean olives. The tree shown on the following pages are illustrative of type only – they were all created for individual clients and give you a taste of the different tree types available and how they might typically look – however remember, the detail is up to you.

Design it - Olive tree case study

A new high end restaurant wanted a feature Olive tree to form the centre piece of their main dining room. However it needed to fit exactly into a reflective dome on the ceiling with a spreading canopy for diners to relax under. Drawings were made of the exact shape and dimensions required for the client to approve along with samples of the foliage type to be used.

The tree was delivered to site on a single pallet and the landscaper assembled it from the full illustrated instructions supplied within an hour.

Now, its famous, used in all the restaurants' marketing material and always a talking point amongst guests, who usually want to rub the leaves as they simply don't believe it isn't alive.

Build It

The secret of our bespoke tree kits is the invisible joints between trunk and branches that are created using metal sleeve inserts with male and female ends that marry together for a truly seamless fit. All branches and their partners are supplied labelled so building is a breeze.

Our preference is to use real recycled trunks and branches to create each unique tree. However, resin trunks are also available.

As you can see in the pictures above the branches slot together in order to create a full head in a matter of minutes.

The pictures on the page opposite show the installation of a tree in a shopping mall. Here the landscaper secured the trunk into a suitable planter (using the bucket base) and then with only the help of a step ladder, two people were able to assemble the whole thing into a beautiful 5m tree in a matter of minutes.

A steel base plate can also be supplied for direct bolting to the floor with the option for larger trees to have the trunk holder clad with bark.

Steel base insert, bark clad
